www.kaup.de
1. Introduction

1.1 Working with this manual

This operating manual contains important information on how to operate the attachment properly, safely and efficiently.

The operating manual shall be read, understood and applied by all personnel working on or with the equipment, for example:

- Installation and operating the equipment
- Inspection, maintenance and repair
- Transport and disposal

The manual must be kept available for ready reference at the equipment's place of use.

The illustrations in this operating manual may deviate from the actual version of the equipment.

1.2 Warning notes and symbols

The following symbols are used in this operating manual to highlight details of special importance:

⚠️ Identifies details relating to do's and don'ts for the purpose of avoiding injury and property damage.

🔍 Specific details relating to the efficient use of the attachment and other advice.

- Lists are denoted by a shadowed box.

- Steps to be performed by the operator are denoted by a black dot.

(1) In illustrations, particular elements have numbered pointers. Numbers in brackets in the text refer to the corresponding elements.

1.3 Copyright

This documentation including all parts is copyrighted. Any use or change outside the narrow limits of copyright law without permission from KAUP GmbH & Co KG is forbidden and liable to prosecution. This applies, in particular, to reproduction, translation, microfilming as well as storage and processing in electronic systems.
1.4 **CE-Mark**

KAUP-Attachments carry the CE-mark. The EC Declaration of Conformity ensures that the attachment conforms to the EC machinery guideline.

1.5 **Qualified and authorised personnel**

Qualified and authorised personnel are equipped by way of their education and training to perform the tasks assigned to them in accordance with accepted practice and safety regulations. They are assigned tasks by the equipment owner.

1.6 **Warranty claims based on defects**

KAUP shall not be liable for any damage to the equipment resulting from:

- Improper use / operation.
- Modifications to components.
- Inappropriate installation, maintenance, inspection and servicing.
- Assignment of unqualified or non-authorised personnel.
- Claims raised by third parties.

1.7 **Limits of applicable use**

KAUP-attachments are intended for use under the following climatic conditions:

- Average ambient temperature for continuous operation: +25°C
- Allowable maximum ambient temperature, short term (up to 1h): +40°C
- Allowable minimum ambient temperature for attachments intended for indoor use: +5°C
- Allowable minimum ambient temperature for attachments intended for outdoor use: -20°C

Standard models of KAUP-attachments are NOT suitable for:

- Use in cold storage facilities.
- Use in explosive environments.
- Use in conjunction with hydraulic systems involving biological oils.
- Use in rough environmental conditions (e.g. seawater).
- The transport of acidic liquids.
2. Safety aspects

- As the user, extend the safety instructions with generally applicable, legal and other measures that ensure a safe and environmentally friendly operation of the attachment.

- Pay close attention to all safety- and danger-related signs on the attachment and in this operating manual. Failure to observe these can result in severe injury or even death.

- Pay close attention to the operating manual provided by the manufacturer of the fork lift truck.

- Keep a safe distance away from moving, reciprocating or rotating parts of the attachment to avoid danger of crushing, pinching or entanglement.

- Notify the responsible department/person immediately of changes and faults in operation of the attachment that affect safety. The attachment shall be shut down.

- Use aids to vision (e.g. mirrors, camera, etc.) where goods being transported obstruct vision.

- Only allow work on the attachment to be carried out by qualified and authorised persons. Adhere to the legal minimum age in the country of operation!

- The attachment should only be used for the purpose intended.

- Never work on or with attachments while under the influence of drugs, alcohol or medicines which affect reaction time.
3. **Design**

The clamp consists of a clamp body (1) and fixed lower arm (3). The upper arm (2) is moved with hydraulic cylinders (4). With model T458C/T498C, the upper arm (2) has a continuous pressure plate (5), and with model T458C-2/T498C-2 it is a split pressure plate. Various linings (6) suitable for the load to be transported are available.

The rotator consists of a base plate (7) and a rotary joint (9), which is hydraulically driven via a gear box with bevel gear (9) and hydraulic motor.

This combination is attached to the fork carriage of the lift truck with brackets (10). The optional side shift (12) is equipped with support rollers (11) and is bolted or welded onto the rotator.

3.1 **Proper use of the equipment**

Rotating roll clamps are designed to rotate loads such as paper rolls, concrete pipes, etc. The rotation can be continuous or limited to 180°, to the left or right as required. The optional side shift is designed for moving loads that are free of the ground (at least 10 cm high).

Proper use of the machine and/or equipment includes the following:

- Observance of the operating manual at all times.
- Observance of the technical data on the identification plate on the attachment.
- Adherence to the specified inspection and maintenance instructions.
3.2 Improper use

- Exceeding the allowable load capacity and load centre.
- Exceeding the maximum permitted torque.
- Transporting the load on a long clamping arm.
- Transporting persons with the load or load handling devices

Mounting auxiliary equipment on the attachment such that the original mode of usage is changed, (e.g. fork extensions) must be authorised by the manufacturer.

3.3 Hydraulic oil flow required

When the hydraulic oil flow is insufficient, the speed of rotation of the rotary units at the attachments will be reduced.

When the hydraulic oil flow is too high, the hydraulic oil temperature will raise which will reduce efficiency and increase wear.

Please refer to the following Specifications:

<table>
<thead>
<tr>
<th>ISO Class, Model family,</th>
<th>Oil flow.</th>
</tr>
</thead>
<tbody>
<tr>
<td>2328</td>
<td>1T - 2,5T</td>
</tr>
<tr>
<td>2</td>
<td>2,5T - 4,8T</td>
</tr>
<tr>
<td>3</td>
<td>4,5T - 5T</td>
</tr>
<tr>
<td></td>
<td>6T - 8T</td>
</tr>
</tbody>
</table>
4. Installation and checking out

4.1 Installation

Installation and commissioning should be performed by qualified and authorised personnel only.

Pay attention to a sufficient load-carrying capacity of the lifting means.

The following are examples of preferred lifting means:

<table>
<thead>
<tr>
<th>Capacity</th>
<th>Part-no.</th>
</tr>
</thead>
<tbody>
<tr>
<td>250 kg/M16</td>
<td>9710160008</td>
</tr>
<tr>
<td>1200 kg/M16</td>
<td>0360010201</td>
</tr>
<tr>
<td>2000 kg/M16</td>
<td>0360010301</td>
</tr>
</tbody>
</table>

4.1.1 Modell T458 without sideshift
4.1.2 Modell T498 with sideshift

- Hoist the attachment at the positions indicated (1).
- Demount the lower hooks (2).
- Mount the attachment on the fork carriage of the lift truck (3).
- Check that the attachment is correctly seated in the centre lock (4).
- Mount the lower hooks (2), tightening the screws (5) with a torque of 190 Nm.
- Replace the plug screw (6) in the gear box with the vent screw supplied.
- Connect the hose lines (7) to the hydraulic connectors on the lift truck.

Trucks equipped with attachments which hold the load by power (e.g. paper clamp) shall feature control(s) with a secondary action to prevent unintentional release of the load. Also take note in this respect of the operating instruction of the lift truck.

Before initial operation, check the functions and the identification of the attachment with the movement directions of the operating elements (operating lever, joystick, etc.).

Mount the residual carrying capacity notice and identification of the operating elements (if not already present) of the combination of lift truck/attached equipment on the lift truck.
4.2 Checking out

KAUP-attachments are delivered pre-lubricated. If the attachment has been in storage for a longer period, we recommend that it be lubricated again before being placed in service. See 6. Maintenance and onwards.

Failure of the safety devices (e.g. the pressure relief valve and the non-return valve) and incorrect connection of the controls to the actuators can cause malfunctioning of the attachment and damage to it. After mounting and before initial operation, check the functions and the identification of the attached equipment with the movement directions of the operating elements (operating lever, joystick, etc.).

4.2.1 Bleeding the hydraulic system

- Start the lift truck.
- Move the sideshifter repeatedly in both directions to maximum extent.
- Rotate the rotator left and right several times.
- Repeatedly cycle the clamp from the fully open to the fully closed position.
- Inspect the hydraulic connections for leakage.

4.2.2 Adjustment after putting into service

The hydraulic system is under pressure. During work on hydraulic components oil spurtting out can cause injuries. Unload the system in accordance with the operating instructions of the lift truck manufacturer. In the case of injuries caused by high pressure oil, inform the works physician and seek out a specialist immediately.

- Setting the clamping pressure with a pressure limiting valve

Attachments are adjusted ex-factory to a pressure of 160 bar.

A change in pressure is necessary only, if the load

- slips or
- is damaged.
Make the settings in the numerical sequence and in the direction of the arrows.

The pressure indication on the manometer gauge drops after clamping. This is not a malfunction of the attachment, being caused by the installation of a transmission.

5. Operation

5.1 General

At least once per working shift, the machine and equipment must be inspected for visible damage and defects.

Repeat faults to your superior and have them rectified without delay.

Be aware of persons present in the area where you are working or driving and ensure that they are not endangered.

Do not transport any load exceeding that specified on the residual load plate for the particular combination of lift truck and attachment.

5.2 Load handling

Position the mast vertically and take up the load parallel to the floor.

Move the roll clamp to the load until the pressure plates and the centre of gravity of the load are diagonal.

Position the mast vertically and take up the load parallel to the floor.

Raise the load about 300 mm and tilt the mast backwards.

Centre the load to the middle of the lift truck during take-up and transport.
5.3 Driving

- Make sure the load to be lifted and the pressure plates are in perfect condition.
- Do not drive with the mast tilted forward.
- Take care when driving that neither the attachment nor the load comes into contact with the ground.

5.4 Rotate

- Rotation can cause damage to the load and the attachment. Ensure sufficient distance of the load to the floor, the ceiling, to shelves, etc.
- If higher torque than specified is generated by the load, the rotation device rotates uncontrolled or not at all. This can lead to damage to the load and the attachment. Note the torque given on the type plate of the attachment.
- The torque given on the type plate refers to the pressure difference of 125 bar at the hydraulic motor.
- Only rotate loads parallel to the floor (set lifting frame vertically).
- Do not rotate loads if there are people in the working area.
- Rotate raised loads slowly. Fast rotating can influence the stability of the lift truck.

6. Maintenance and servicing

6.1 General

Regular maintenance is essential to ensure reliable operation and long service life of the KAUP attachment.

- Ensure that maintenance and servicing are performed by qualified and authorised personnel only.
- Lubrication and cleaning work on the attachment may also be performed by the lift truck operator.
- Perform maintenance and servicing work only when the attachment is parked securely on a stable, level foundation. For installing and removing, it is recommended to use a pallet to take the attachment. The attachment can thus be securely placed and transported.
- Pay attention to a sufficient load-carrying capacity of the lifting means.
Replace missing or defective warning signs on the attachment.

Do not use third party spare parts. Through poor quality or incorrect matching they can result in a risk of accident. The EC Declaration of Conformity by the manufacturer becomes invalid and you assume full responsibility in the case of accident.

Use only original spare parts from the manufacturer.

The hydraulic system is under pressure. During work on hydraulic components oil spurting out can cause injuries. Unload the system in accordance with the operating instructions of the lift truck manufacturer. In the case of injuries caused by high pressure oil, inform the works physician and seek out a specialist immediately.

Screw connections can loosen due to vibration of the attachment. During routine maintenance check that screw connections are correctly torqued and replace screws which are visibly damaged.

Note the following tightening torques which are valid for screws with connecting surfaces according to ISO 4762, ISO 4014, ISO 4032 etc.:

<table>

<td>640Nm</td>
</tr>
</tbody>
</table>

Failure of the safety devices (e.g. the pressure relief valve and the non-return valve) and incorrect connection of the controls to the actuators can cause malfunctioning of the attachment and damage to it.

After mounting and before initial operation, check the functions and the identification of the attached equipment with the movement directions of the operating elements (operating lever, joystick, etc.).

6.2 Significant modification

Significant modifications are, for example, those which affect the stability, performance, speed and strength of components.

The EC Declaration of Conformity is invalidated by a significant modification of the attachment.

Modifications to the attachment may only be made with prior approval by the manufacturer.
6.3 Schedule for routine maintenance and lubricants

</tbody>
</table>

The specified maintenance schedules can change as a result of the operating conditions such as extreme cold, heat and dust or poor ground conditions and this must be taken into account by the owner.

With other loads, such as fork arms with a length of over 2,400 mm or raised load centres, amended/shorter maintenance intervals should be agreed by the user with the manufacturer.
6.3.1 Upper clamping arm

6.3.2 Lower clamping arm
Daily

Check all lines, hoses and connections for leakage and damage.

After 50h / every 500h thereafter

Check screws:

- (1) Sealing ring (3) on the cylinder (8).
- (2) on the bolts (7, 9, 10, 13, 14, 15):

Replace loose or damaged screws. Torque the screws as specified in Chapter 6.1 General.

Weekly

Grease:

- Sliding pieces (5, 6) by way of the greasing nipples (4).

Every 200h

Check wear on:

- bolt (7, 9, 10, 15).

As necessary

For replacing worn or faulty sliding pieces (6) – Please contact KAUP service.

Renew the worn pressure plates (11, 17) or their linings by demounting the cotter pin (13), washer (14), pin (15) and spring (16). Knock out the bolt (15) sideways.

Replace worn pressure plates and/or linings. Remount the pin (15) and spring (16). Ensure exact positioning of the spring (20) during installation. Afterwards, remount the washer (14) and cotter pin (13).
6.3.3 Rotator and clamp body

6.3.4 Rotator mounting without sideshift
6.3.5 Rotator mounting with sideshift

Daily

Check all lines, hoses and connections for leakage and damage.

After 50h / every 500h thereafter

Check screws:

- (1) on the slewing ring (3) / clamp body (2).
- (4, 5) on the slewing ring (3) / base plate (7).
- (8, 9, 11) on the gear (10).
- (12) on the oil motor (13).
- (16) on the base plate (7).
- (17) on the upper hooks (18).
- (19) on the spacer (20) and lower hooks (21).
- (24) on the sideshifter housing (25).
- (26) on the lower hooks (27).
Replace loose or damaged screws. Torque the screws as specified in Chapter 6.1 General.

**Weekly**

Grease:
- Sliding pieces (23) by way of the greasing nipples (22).
- Supporting rollers (28) on the lower hooks (27) as necessary.

**Every 200h**

Check wear on:
- Sliding pieces (23).
- Supporting rollers (28).

Prevent entry of dirt, water or moisture into the slewing ring.

Grease:
- Slewing ring (3) by way of the greasing nipples (14).
- Gearing of the rotary joint (3) by way of the greasing nipples (15).

**Every 500h**

Check the oil level of the gear box (10).

**After 2500h / every 2000h thereafter**

Change the gear box oil (Information KAUP customer service).

**Yearly**

Check the clearance in the rotary joint (3). (Information KAUP customer service)

**As necessary**

Renew worn sliders (23) by removing the hooks (27). Remove the complete rotating roll clamp in the reverse order to that described in section 4.1. Replace the sliders (23). During installation pay close attention that the sliders (23) are seated correctly. Then fit the complete rotating roll clamp as described in section 4.1.

Replace defective supporting rollers (28) in the hooks (27) by removing the screws (26). Using suitable hoisting gear tilt the complete rotating roll clamp forwards away from the fork carriage on the lift truck. Remove the bolts (29) in the hooks (27), remove the defective supporting rollers (28) and replace them with new ones. Remount the complete rotating roll clamp in the reverse order.

Legend: LT = lift truck, DBV = Pressure relief valve, WE-Drossel = elbow-type screwed throttle, RJ = rotary joint

8. Disposal

Prevent environmental damage by disposing of the following items properly in accordance with relevant national regulations:

- Hydraulic fluids, greases, lubricants and soiled working materials (Cleaning rags, etc.)
- Packaging material (Pallets, straps, cartons and plastic sheeting)

After decommissioning, the attachment should be disposed of in accordance with local legislation and regulations.

9. Transport

During transport of the attachment, care should be given to using appropriate means of support (e.g. pallets). These must not be damaged. The attachment must be secured against slipping or tipping over on the support.

10. Decommissioning and storage

If the attachment is to be stored for an extended period, all hydraulic connectors must be sealed against contamination and damage. Store the attachment in a clean, dry environment.

11. Spare parts list (not part of the Operating Manual)
12. EC Declaration of Conformity (Summary)

KAUP GMBH & Co. KG
Braunstraße 17
D-63741 Aschaffenburg

we hereby declare that the machinery
