Original Operating Manual 3
1. Introduction

1.1 Working with this manual

This operating manual contains important information on how to operate the attachment properly, safely and efficiently.

The operating manual shall be read, understood and applied by all personnel working on or with the equipment, for example:

- Installation and operating the equipment
- Inspection, maintenance and repair
- Transport and disposal

The manual must be kept available for ready reference at the equipment's place of use.

The illustrations in this operating manual may deviate from the actual version of the equipment.

1.2 Warning notes and symbols

The following symbols are used in this operating manual to highlight details of special importance:

⚠️ Identifies details relating to do's and don'ts for the purpose of avoiding injury and property damage.

👉 Specific details relating to the efficient use of the attachment and other advice.

- Lists are denoted by a shadowed box.

- Steps to be performed by the operator are denoted by a black dot.

(1) In illustrations, particular elements have numbered pointers. Numbers in brackets in the text refer to the corresponding elements.

1.3 Copyright

This documentation including all parts is copyrighted. Any use or change outside the narrow limits of copyright law without permission from KAUP GmbH & Co KG is forbidden and liable to prosecution. This applies, in particular, to reproduction, translation, microfilming as well as storage and processing in electronic systems.
1.4 CE-Mark

KAUP-Attachments carry the CE-mark. The EC Declaration of Conformity ensures that the attachment conforms to the EC machinery guideline.

1.5 Qualified and authorised personnel

Qualified and authorised personnel are equipped by way of their education and training to perform the tasks assigned to them in accordance with accepted practice and safety regulations. They are assigned tasks by the equipment owner.

1.6 Warranty claims based on defects

KAUP shall not be liable for any damage to the equipment resulting from:

- Improper use / operation.
- Modifications to components.
- Inappropriate installation, maintenance, inspection and servicing.
- Assignment of unqualified or non-authorised personnel.
- Claims raised by third parties.

1.7 Limits of applicable use

KAUP-attachments are intended for use under the following climatic conditions:

- Average ambient temperature for continuous operation: +25°C
- Allowable maximum ambient temperature, short term (up to 1h): +40°C
- Allowable minimum ambient temperature for attachments intended for indoor use: +5°C
- Allowable minimum ambient temperature for attachments intended for outdoor use: -20°C

Standard models of KAUP-attachments are NOT suitable for:

- Use in cold storage facilities.
- Use in explosive environments.
- Use in conjunction with hydraulic systems involving biological oils.
- Use in rough environmental conditions (e.g. seawater)
- The transport of acidic liquids.
2. Safety aspects

As the user, extend the safety instructions with generally applicable, legal and other measures that ensure a safe and environmentally friendly operation of the attachment.

Pay close attention to all safety- and danger-related signs on the attachment and in this operating manual. Failure to observe these can result in severe injury or even death.

Pay close attention to the operating manual provided by the manufacturer of the fork lift truck.

Keep a safe distance away from moving, reciprocating or rotating parts of the attachment to avoid danger of crushing, pinching or entanglement.

Notify the responsible department/person immediately of changes and faults in operation of the attachment that affect safety. The attachment shall be shut down.

Use aids to vision (e.g. mirrors, camera, etc.) where goods being transported obstruct vision.

Only allow work on the attachment to be carried out by qualified and authorised persons. Adhere to the legal minimum age in the country of operation.

The attachment should only be used for the purpose intended.

Never work on or with attachments while under the influence of drugs, alcohol or medicines which affect reaction time.
3. Design

A rotator consists of a base plate (1) and a rotary joint (2), which is hydraulically driven via a gear box with bevel gear (3) and an oil motor (4). A fork carriage with welded flange (5) is bolted to the rotary joint (2). The fork carriage (6) has safety retaining stops (7) and limit stops (6) that lock the fork arms when rotating. This combination is attached to the fork carriage of the lift truck with an upper hanger assembly (8) and lower bracket (9).

The optional side shift (10) is equipped with support rollers (11) and is bolted or welded onto the rotator.

3.1 Efficient equipment settings on electric vehicles

Please use our reference values for setting the lift trucks and attachments. These are found at www.kaup.de in the Services -> Product Support section.

3.2 Proper use of the equipment

Rotators are intended for rotating loads such as crates, containers etc. that have been picked up with fork arms. The rotation can be continuous or limited to 180°, to the left or right as required. The optional side shift is designed for moving loads that are free of the ground (at least 10 cm high).
Proper use of the machine and/or equipment includes the following:

- Observance of the operating manual at all times.
- Observance of the technical data on the identification plate on the attachment.
- Adherence to the specified inspection and maintenance instructions.

3.3 Improper use

- Exceeding the allowable load capacity and load centre.
- Exceeding the maximum permitted torque.
- Transporting persons with the load or load handling devices.
- Mounting auxiliary equipment on the attachment such that the original mode of usage is changed, (e.g. fork extensions) must be authorised by the manufacturer.

3.4 Hydraulic oil flow required

When the hydraulic oil flow is insufficient, the speed of rotation of the rotary units at the attachments will be reduced.

When the hydraulic oil flow is too high, the hydraulic oil temperature will raise which will reduce efficiency and increase wear.

Please refer to the following Specifications:

<table>
<thead>
<tr>
<th>ISO Class, Model family, Oil flow.</th>
</tr>
</thead>
<tbody>
<tr>
<td>2328</td>
</tr>
<tr>
<td>2</td>
</tr>
<tr>
<td>4</td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>
4. Installation and checking out

4.1 Installation

Installation and commissioning should be performed by qualified and authorised personnel only.

Pay attention to a sufficient load-carrying capacity of the lifting means.

The following are examples of preferred lifting means:

<table>
<thead>
<tr>
<th>Capacity</th>
<th>Part-no.</th>
</tr>
</thead>
<tbody>
<tr>
<td>250 kg/M16</td>
<td>9710160008</td>
</tr>
<tr>
<td>1200 kg/M16</td>
<td>0360010201</td>
</tr>
<tr>
<td>2000 kg/M16</td>
<td>0360010301</td>
</tr>
</tbody>
</table>

4.1.1 Rotator with and without sideshift
4.1.2 Fork carriage

- Replace the plug screw (6) in the gear box with the vent screw supplied.

- Ensure that no oil leaks out of the gear transmission.

- Hoist the attachment at the positions indicated (1).

- Demount the lower hooks (2).

- Mount the attachment on the fork carriage of the lift truck (3).

- Check that the attachment is correctly seated in the centre lock (4).

- Mount the lower hooks (2), tightening the screws (5) with a torque of 190 Nm.

- Use pipes or hoses to connect the hydraulic ports (7) to the hydraulic ports of the lift truck.

- Demount the safety retaining stops (8) and limit stops (9) and slide the fork arms from the side onto the fork carriage.

- Ensure that all safety retaining stops (8) and limit stops (9) are remounted.

Before initial operation, check the functions and the identification of the attachment with the movement directions of the operating elements (operating lever, joystick, etc.).
Mount the residual carrying capacity notice and identification of the operating elements (if not already present) of the combination of lift truck/attached equipment on the lift truck.

4.2 Checking out

KAUP-attachments are delivered pre-lubricated. If the attachment has been in storage for a longer period, we recommend that it be lubricated again before being placed in service. See 6. Maintenance and onwards.

Failure of the safety devices (e.g. the pressure relief valve and the non-return valve) and incorrect connection of the controls to the actuators can cause malfunctioning of the attachment and damage to it.

After mounting and before initial operation, check the functions and the identification of the attached equipment with the movement directions of the operating elements (operating lever, joystick, etc.).

4.2.1 Bleeding the hydraulic system

- Start the lift truck.
- Move the sideshifter repeatedly in both directions to maximum extent.
- Rotate the rotator left and right several times.
- Inspect the hydraulic connections for leakage.

4.2.2 Adjustment after putting into service

The hydraulic system is under pressure. During work on hydraulic components oil spurting out can cause injuries. Unload the system in accordance with the operating instructions of the lift truck manufacturer. In the case of injuries caused by high pressure oil, inform the works physician and seek out a specialist immediately.

5. Operation

5.1 General

At least once per working shift, the machine and equipment must be inspected for visible damage and defects. Repeat faults to your superior and have them rectified without delay.

Be aware of persons present in the area where you are working or driving and ensure that they are not endangered.

Do not transport any load exceeding that specified on the residual load plate for the particular combination of lift truck and attachment.
5.2 Load handling

- Set the forks as wide apart as possible for the load to be carried.
- Position the mast vertically and take up the load parallel to the floor.
- Drive the attachment up to the load to maximum extent.
- Raise the load about 300 mm and tilt the mast backwards.
- Centre the load to the middle of the lift truck during take-up and transport.

5.3 Driving

- Make sure the load to be lifted and the pressure plates are in perfect condition.
- Do not drive with the mast tilted forward.
- Take care when driving that neither the attachment nor the load comes into contact with the ground.

5.4 Rotate

- Rotation can cause damage to the load and the attachment. Ensure sufficient distance of the load to the floor, the ceiling, to shelves, etc.
- If higher torque than specified is generated by the load, the rotation device rotates uncontrolled or not at all. This can lead to damage to the load and the attachment. Note the torque given on the type plate of the attachment.
- The torque given on the type plate refers to the pressure difference of 125 bar at the hydraulic motor.
- Only rotate loads parallel to the floor (set lifting frame vertically).
- Do not rotate loads if there are people in the working area.
- Rotate raised loads slowly. Fast rotating can influence the stability of the lift truck.
6. Maintenance and servicing

6.1 General

Regular maintenance is essential to ensure reliable operation and long service life of the KAUP attachment.

Ensure that maintenance and servicing are performed by qualified and authorised personnel only.

Lubrication and cleaning work on the attachment may also be performed by the lift truck operator.

Perform maintenance and servicing work only when the attachment is parked securely on a stable, level foundation. For installing and removing, it is recommended to use a pallet to take the attachment. The attachment can thus be securely placed and transported.

Pay attention to a sufficient load-carrying capacity of the lifting means.

Replace missing or defective warning signs on the attachment.

Do not use third party spare parts. Through poor quality or incorrect matching they can result in a risk of accident. The EC Declaration of Conformity by the manufacturer becomes invalid and you assume full responsibility in the case of accident.

Use only original spare parts from the manufacturer.

The hydraulic system is under pressure. During work on hydraulic components oil spurting out can cause injuries. Unload the system in accordance with the operating instructions of the lift truck manufacturer. In the case of injuries caused by high pressure oil, inform the works physician and seek out a specialist immediately.

Screw connections can loosen due to vibration of the attachment. During routine maintenance check that screw connections are correctly torqued and replace screws which are visibly damaged.

Note the following tightening torques which are valid for screws with connecting surfaces according to ISO 4762, ISO 4014, ISO 4032 etc.:

<table>

</tbody>
</table>
During any disassembly operations, be sure that parts to be disassembled can easily be removed. For removing parts, use the clearance between bolts and the parts to be removed.

Our service videos available at www.kaup.de in the **Online Services** section may be used for assistance as necessary.

Failure of the safety devices (e.g. the pressure relief valve and the non-return valve) and incorrect connection of the controls to the actuators can cause malfunctioning of the attachment and damage to it.

After mounting and before initial operation, check the functions and the identification of the attached equipment with the movement directions of the operating elements (operating lever, joystick, etc.).

### 6.2 Significant modification

Significant modifications are, for example, those which affect the stability, performance, speed and strength of components.

The EC Declaration of Conformity is invalidated by a significant modification of the attachment.

Modifications to the attachment may only be made with prior approval by the manufacturer.

### 6.3 Schedule for routine maintenance and lubricants

</tbody>
</table>
The specified maintenance schedules can change as a result of the operating conditions such as extreme cold, heat and dust or poor ground conditions and this must be taken into account by the owner.

With other loads, such as fork arms with a length of over 2,400 mm or raised load centres, amended/shorter maintenance intervals should be agreed by the user with the manufacturer.

6.3.1 Rotator
6.3.2 Mounting rotator with and without sideshift

Daily

Check all lines, hoses and connections for leakage and damage.

After 50h / every 500h thereafter

Check screws:

- (1) through the openings (1a, 1b) on the slewing ring (2) / base plate (3).
- (4, 5, 7) on the gear (6).
- (8) on the oil motor (9).
- (12) on the lower hooks (13).
- (16) on the upper hooks (17).

Replace loose or damaged screws. Torque the screws as specified in Chapter 6.1 General.

Weekly

Grease:

- Sliding pieces (15) by way of the greasing nipples (14).
- Supporting rollers (18) on the lower hooks (17, 19) as necessary.
- Supporting rollers (24) by way of the greasing nipples (26), model 8T.
Every 200h

- Check wear on:
  - Sliding pieces (15).
  - Supporting rollers (18, 24).

- Prevent entry of dirt, water or moisture into the slewing ring.

Grease:

- Slewing ring (2) by way of the greasing nipples (10).
- Gearing of the rotary joint (2) by way of the grease nipple (11).

Every 500h

- Check the oil level of the gear box (6).

After 2500h / every 2000h thereafter

- Change the gear box oil. (Information KAUP customer service)

Yearly

- Check the clearance in the rotary joint (2). (Information KAUP customer service)

As necessary

Renew worn sliding pieces (15) by removing the hooks (17). Demount the nut (20) of the cylinder (21). Remove the complete rotator in the reverse order to that described in section 4.1. Replace the sliding pieces (15). During installation pay close attention that the sliders (15) are seated correctly in the ground plate (23). Mount the complete rotator again afterwards as described in Chapter 4.1 and ensure that the nut (20) for the cylinder (21) has been replaced.

Modell 8T: Renew worn sliding pieces (15) by removing the hooks (17). Demount the nut (20) of the cylinder (21). Remove the complete rotator in the reverse order to that described in section 4.1. Replace the sliding pieces (15). During installation pay close attention that the sliders (15) are seated correctly in the ground plate (23). Mount the complete rotator again afterwards as described in Chapter 4.1 and ensure that the nut (20) for the cylinder (21) has been replaced.

- Replace defective supporting rollers (18) in the hooks (17) by removing the screws (16). Tilt the complete rotator forwards from the fork carriage of the lift truck with suitable lifting equipment. Remove the bolts (19) in the hooks (17), remove the defective supporting rollers (18) and replace them with new ones. Remount the complete rotator in the reverse sequence.
Modell 8T: Renew defective support rollers (24) by removing the bolts (16). Demount the nut (20) of the cylinder (21). Remove the complete rotator in the reverse order to that described in section 4.11. Demount the bolt (25) in the base plate (23), remove the defective support rollers (24) and replace with new support rollers. Mount the complete rotator again in the reverse sequence and ensure that the nut (20) for the cylinder (21) has been replaced.

After installing or removing a cylinder (21) and nut (20), always check the clearance (20) between the cylinder mount and nut (20) of the cylinder (21). Cylinders are installed with axial clearance of 1.5 to 2 mm.

6.3.3 Fork carriage
After 50h / every 500h thereafter

Check screws:
- (1, 4) on the fork carriage (2) / slewing ring (5).
- (6) and washer (7) on the fork carriage (2).
- (8) and limit stops (9) on the fork carriage (2).

Replace loose or damaged screws. Torque the screws as specified in Chapter 6.1
General.

Yearly

Check the wear on the safety retaining stops (6, 7). Replace defective bolts (6) and
washers (7).

Check the wear on the bolts (8) and limit stops (9). Replace the defective parts.

Ensure that all safety retaining stops (6, 7) and limit stops (8, 9) are remounted after
mounting or demounting fork arms.

6.3.4 Identification plate and caution board
### Number | Description | KAUP order number
--- | --- | ---
1 | Identification plate | only by Quality department
2 | Before putting into operation carefully read and take note of the operating and security instructions. | 0100016401
3 | Never reach into the unit as long as parts could still be moving due to the danger of squashing or shearing. | 0100016601
4 | Use suspension point! | 0100015001
5 | koxxxxxx | KAUP – order number without, engraved in the material

### 7. Troubleshooting

Troubleshooting should only be performed by qualified and authorised personnel.

Legend: FFZ = lift truck
8. **Disposal**

Prevent environmental damage by disposing of the following items properly in accordance with relevant national regulations:

- Hydraulic fluids, greases, lubricants and soiled working materials (Cleaning rags, etc.)
- Packaging material (Pallets, straps, cartons and plastic sheeting)

After decommissioning, the attachment should be disposed of in accordance with local legislation and regulations.

9. **Transport**

During transport of the attachment, care should be given to using appropriate means of support (e.g. pallets). These must not be damaged. The attachment must be secured against slipping or tipping over on the support.

10. **Decommissioning and storage**

If the attachment is to be stored for an extended period, all hydraulic connectors must be sealed against contamination and damage. Store the attachment in a clean, dry environment.

11. **Spare parts list** (not part of the Operating Manual)

12. **EC Declaration of Conformity (Summary)**

KAUP GMBH & Co. KG • Braunstraße 17 • D-63741 Aschaffenburg

we hereby declare that the machinery
